AN INVISIBLE INFRASTRUCTURE THAT CONNECTS EVERY STEP OF THE RADIOPHARMACEUTICAL JOURNEY

SAFE

Shielded Transport

INTELLIGENT

Synchronized Workflows

DISTRIBUTED

Connected Everywhere

SECURE

Controlled & Compliant

IMPACTFUL

Better Outcomes, Faster

MOVING WHAT MATTERS.
SAFELY. INTELLIGENTLY. ON TIME.

MRTWay

THE PROBLEM

Production Capacity Is Growing Faster Than Clinical Delivery Infrastructure

Hospitals continue to invest in cyclotron production capacity to meet growing demand for nuclear medicine and precision oncology. However, clinical delivery infrastructure within hospitals is **not expanding** at the same rate.

U.S. Cyclotron Infrastructure Trend

Cumulative Energy Capacity vs Physical Institution Count

U.S. Cyclotron Infrastructure Summary

Year	1985	1995	2005	2012	2020
Physical Institutions (Count)	2	30	150	187	193
Cumulative Capacity (MeV)	120	555	2,547	3,174	3,301

Source: Kim, J.H. et al. "Cyclotron infrastructures and nuclear medicine activities" in the United States, the United Kingdom, and the Republic of Korea." EJNMMI Physics (2020).

THE CONSEQUENCES OF THIS IMBALANCE

LONGER WAIT TIMES

Patients wait longer for scans and treatments.

LOWER THROUGHPUT

One production batch is used for the entire day.

DOSE DECAY LOSSES

Radiopharmaceuticals decay over time, reducing effective dose delivered.

FINANCIAL IMPACT

Hospitals lose value through waste, inefficiency, and missed capacity.

CAPACITY BOTTLENECK

Production capacity is underutilized due to infrastructure limits.

The bottleneck is no longer isotope production.

The bottleneck is clinical delivery infrastructure.

Hospitals need a way to safely and efficiently move radiopharmaceuticals farther and faster across their campuses.

THE MRT SOLUTION: TURN ONE CLUSTER INTO A DISTRIBUTED NETWORK

TODAY: TRADITIONAL CLUSTER MODEL

1

Cluster

2

PET/CT Scanners

1

Batch Per Day

WITH MRT: DISTRIBUTED CAMPUS MODEL

1

Cluster

6+

PET/CT Scanners

3-4x

Throughput Potential

Multiple

Batches Per Day

MRT PHARMA CREATES INSTITUTION-EQUIVALENT DELIVERY CAPACITY.

We help hospitals match their clinical delivery capacity to their growing production capacity—unlocking throughput, improving patient outcomes, and protecting revenue.

- ✓ Distributed. Shielded. Controlled.
- ✓ Built for Nuclear Medicine.
- ✓ Designed for Precision Oncology.

MRTWay

INDUSTRY SHIFT

Precision Oncology Is Becoming Distributed

The future of oncology care is moving from centralized facilities to connected, campus-scale precision medicine networks.

PRECISION ONCOLOGY

- Right treatment
- Right patient
- Right time

THERANOSTICS GROWTH

- PET imaging expansion
- Targeted radioligand therapies
- Radiopharmaceutical demand accelerating

CAMPUS EXPANSION

- Cancer centers expanding into adjacent buildings
- Multi-building clinical campuses
- Distributed care environments

GROWING CYCLOTRON CAPACITY

- Existing institutions increasing production
- Capacity growth outpacing facility growth
- More isotopes, more therapies, more impact

CONNECTED CARE NETWORKS

- Imaging
- Treatment
- Inpatient Care
- Research
- Outpatient Services
- All seamlessly connected

FROM: CENTRALIZED ONCOLOGY

Care concentrated in single buildings and departments.

TO: DISTRIBUTED PRECISION ONCOLOGY

Care delivered across connected campuses for greater access and better outcomes.

The industry is evolving. The infrastructure must evolve with it.

MRTWay

THE SOLUTION

MRT Pharma: External Infrastructure for Distributed Oncology Delivery

MRTWay is the external infrastructure layer that moves radiopharmaceuticals and associated materials safely, securely, and intelligently across hospital campuses—connecting every critical point of care.

We turn one clustered institution into a distributed oncology network, unlocking the full value of today's production capacity.

HOW MRTWay WORKS

TODAY: TRADITIONAL CLUSTERED MODEL

Everything happens in ONE building.

- ⊗ Long patient queues
- ⊗ One production batch per day
- ⊗ Dose decay throughout the day
- ⊗ Manual transport via elevators & staff
- ⊗ Limited scanner capacity
- ⊗ Underutilized production capacity

WITH MRTWay: DISTRIBUTED CAMPUS MODEL (EXPANDED REACH)

One radiopharmacy. Many destinations. Unlimited potential.

- ✓ Multiple destinations across campus
- ✓ Smaller, repeated batches per day
- ✓ Less decay, higher dose quality
- ✓ Automated transport, no elevator delays
- ✓ More scanners utilized
- ✓ Higher throughput & revenue

THE IMPACT: UNLOCK EXISTING PRODUCTION CAPACITY & INCREASE THROUGHPUT

TRADITIONAL CLUSTERED MODEL (ALL IN ONE BUILDING)

CYCLOTRON CAPACITY (Existing)	CAPACITY EXPANSION (Linear & Expensive)	SCANNERS (In Same Building)	BATCHES PER DAY	EFFECTIVE DAILY THROUGHPUT (Relative)	
100 MeV	× 2 (New CapEx)	2	1	200 (100 × 2 × 1)	• Still one batch per day. • Dose decays over time. Longer waits.

⊗ Higher CapEx. Limited throughput improvement.

MRT DISTRIBUTED MODEL (SAME HOSPITAL, EXPANDED REACH)

CYCLOTRON CAPACITY (Minimal Expansion)	ADDITIONAL SCANNERS VIA MRT (Across Campus)	BATCHES PER DAY	EFFECTIVE DAILY THROUGHPUT (Relative)	COST & BENEFIT ADVANTAGE
100 × 1.3 = 130 MeV (Lower CapEx)	+6 (Total & Scanners)	2	260 (130 × 2)	• Lower CapEx vs doubling • 30% more capacity for much less cost • Double the daily throughput • Higher revenue potential

THE RESULT

**More Throughput.
Better Dose Quality.
Happier Patients.
Higher Revenue.**

MRTWay helps hospitals convert excess production capacity into distributed clinical capacity—without building new cyclotrons.

SAFE
Shielded at Every Step

SECURE
Closed System.
No Exposure.

SMART
Real-Time Tracking.
Intelligent Routing.

TIMELY
Minimized Decay.
Maximum Impact.

SUSTAINABLE
Return & Recovery.
Waste Responsibility.

**Move More. Treat More.
Live More.**

MRTWay

WHY NOW

Infrastructure Has Not Kept Pace

Radiopharmaceutical production and clinical demand are growing faster than the logistics systems that connect them.

1. GROWING DEMAND

Theranostics adoption is accelerating worldwide.

PET/CT procedures are increasing exponentially.

Oncology patient volumes continue to rise.

2. INFRASTRUCTURE GAP

Cyclotron Capacity Is Increasing Faster Than the Number of Facilities (South Korea, UK, US)

Source: Kim et al. (2021) Applied Radiation and Isotopes

Cyclotron capacity is increasing faster than the number of facilities.

3. EXISTING SOLUTIONS HAVE LIMITS

Pneumatic Tubes (Telelift)

Point-to-point only

AGVs (Swisslog)

Slow, floor congestion, limited scalability

Manual Transport

Labor intensive, variable safety

4. PRECISION ONCOLOGY REQUIRES SPEED

- ✓ Decay-sensitive payloads lose value fast.
- ✓ ALARA requirements demand controlled transport.
- ✓ Timely delivery is critical to treatment effectiveness.

5. POLICY MOMENTUM

Regulatory pathways for novel radiopharmaceuticals are evolving.

Government initiatives support domestic isotope production.

Resilience and supply chain security are national priorities.

The next bottleneck in precision oncology is not production.
It is movement.

MRTWay

ECONOMIC LOGIC

Expand Throughput Without Proportional Cyclotron Expansion

MRTWay enables hospitals and health systems to do more with what they have—
increasing capacity, efficiency, and margins.

THE CHALLENGE

Cyclotron capacity is expensive and slow to expand.

New cyclotron: \$5M – \$15M+
High capital cost

Lead time: 18 – 36 months+
Permitting, shielding,
construction, validation

Space & infrastructure intensive
Limited by real estate,
utilities, and staffing

Cyclotron capacity expansion
cannot keep pace with
growing demand.

THE MRTWAY SOLUTION

Move more doses, more efficiently,
across the campus.

INCREASE THROUGHPUT

Faster, more reliable
delivery enables
more patients per
day per cyclotron.

IMPROVE UTILIZATION

Reduce downtime
and missed
appointments
due to delays.

LOWER OPERATING COSTS

Automated,
consolidated transport
reduces labor,
errors, and waste.

SCALE WITHOUT NEW CAPEX

Add capacity
through logistics,
not more
infrastructure.

Expand throughput without proportional
cyclotron expansion.

THE ECONOMIC IMPACT

Stronger margins. Faster growth.
Better patient access.

MORE PATIENTS

Increase scans & treatments
per day per cyclotron

HIGHER REVENUE

Capture unmet demand and
grow service lines

LOWER COST PER DOSE

Reduce labor, delays,
and operational waste

BETTER ROI

Improve asset utilization
and return on existing capex

Do more. Sooner.
More profitably.

ILLUSTRATIVE ECONOMIC EXAMPLE

+30–50%

Increase in daily dose
throughput per cyclotron

-20–30%

Reduction in transport time
and labor cost

+2–5x

Faster capacity expansion
vs. adding a new cyclotron

**STRONGER FINANCIALS.
GREATER IMPACT.
BETTER PATIENT CARE.**

MRTWay turns existing cyclotron capacity into greater clinical, operational, and financial capacity.

MRT Pharma COMPETITION

Purpose-Built for Radiopharmaceutical Logistics

CAPABILITY	MRT Pharma	Telelift (Robotics)	Swisslog (Tubes)	Manual Transport
 Shielded Payload Transport	✓	⚠ Moderate*	✗	✗

 Decay-Sensitive Workflow Optimization	✓	✗	✗	✗
 Precision Oncology / Radiopharma Focus	✓	✗	✗	✗
 Real-Time Tracking & Coordination	✓	✓	✓	✗

MRT Pharma

Distributed radiopharmaceutical infrastructure

- Purpose-built for radiopharmaceuticals
- Shielded payload movement
- Multi-building campus coordination
- Designed for decay-sensitive workflows
- Optimized for precision oncology

Telelift (Robotics)

Automated mobile robotics for hospitals

- Fully automated robots
- Multi-building campus routing
- Real-time tracking & coordination
- Not designed for radiopharmaceuticals
- Not optimized for decay-sensitive workflows

Swisslog (Tubes)

Pneumatic tube systems

- Point-to-point transport
- Moderate multi-building capability*
- Real-time tracking & monitoring
- Not designed for radiopharmaceuticals
- Not optimized for decay-sensitive workflows

Manual Transport

Hand-carried movement

- Labor intensive
- Radiation exposure risk
- No real-time visibility
- Difficult to scale
- Inefficient and inconsistent

Shielded Payloads

Faster Throughput

Campus-Scale Routing

Precision Oncology Ready

Telelift automates hospital logistics.

Swisslog moves materials.

MRT Pharma moves radiopharmaceuticals.

* Possible with customization but not the primary design focus.

MRT Pharma TECHNOLOGY

Patent-Backed MRTWay™ Platform

Purpose-built transport infrastructure for radiopharmaceutical logistics.

WHAT MRTWAY™ DOES

Connects Radiopharmacy
→ Imaging → Injection →
Therapy

Moves decay-sensitive
radiopharmaceuticals
safely

Supports shielded
payload handling

Improves throughput
across distributed
cancer campuses

Enables real-time
tracking and workflow
coordination

WHY IT'S DIFFERENT

Existing Systems	MRTWay™
 General hospital logistics	 Radiopharmaceutical logistics
 Point-to-point movement	 Campus-wide coordination
 Manual handoffs	 Automated workflows
 Not oncology focused	 Precision oncology focused

INTELLECTUAL PROPERTY

- ✓ Magnetic Resonant Transport Systems
- ✓ Segmented Transport Architectures
- ✓ AI-Assisted Routing & Coordination
- ✓ Energy Recovery Technologies
- ✓ Cleanroom & Clinical Logistics Applications

PATENT-BACKED INFRASTRUCTURE
DESIGNED SPECIFICALLY FOR

THERANOSTICS

RADIOPHARMACEUTICALS

PRECISION ONCOLOGY

BUSINESS MODEL

Multiple **Recurring** Revenue Streams

1. INSTALLATION

- Hospital campus deployment
- Infrastructure integration
- Workflow configuration

One-time revenue

2. LICENSING

- MRTWay™ platform license
- Software & IP rights
- Routing & workflow algorithms

Recurring annual revenue

3. SOFTWARE

- Real-time tracking
- Analytics dashboard
- Performance monitoring
- Compliance reporting

Recurring (SaaS) revenue

4. MAINTENANCE

- Preventive maintenance
- Software updates
- Technical support
- System optimization

Recurring annual revenue

High-margin recurring revenue from licensing, software, and maintenance.
